
1. Cinematographer

This role is responsible for the "raw ingredients." If it isn't captured correctly here, it can't be "fixed in post"—at least not without a headache.

- **Cinematography & Framing:**
 - Selecting focal lengths and apertures to match the desired depth of field.
 - Executing camera movement (gimbal, dolly, or handheld) to add energy or focus.
- **Lighting Design:**
 - Setting up the primary "Key," "Fill," and "Back" lights.
 - Managing "Practical" lights (on-set lamps/fixtures) and color temperature to ensure skin tones look natural.
- **Audio Capture:**
 - Placing lavalier or boom mics for clean dialogue.
 - Monitoring "scratch audio" on the camera for easier syncing later.
- **Photography:**
 - Capturing high-resolution stills for thumbnails, promotional materials, or inserts.
 - Studio lighting and photography for graphics design use.
- **DIT (Digital Imaging Technician) & Ingest:**
 - **Ingest:** Transferring media from cards to storage.
 - **Organization:** Naming folders and files using appropriate naming conventions.
 - **Verification:** Using checksums to ensure no data was lost during the transfer.

2. Video Editor

The editor is the storyteller who takes the raw assets and finds the "soul" of the video.

- **Project Initialization:**
 - Setting up the project file structure (Footage, Audio, Assets, Renders).
 - Syncing multi-cam clips and external audio tracks.
- **The Assembly & Rough Cut:**
 - Selecting the best takes and laying them on the timeline to check the pacing.
 - **B-Roll Integration:** Layering visual coverage over talking head or VO segments to illustrate the narrative.
- **Audio Processing:**
 - Cleaning up background noise and applying EQ/Compression so voices sound natural.
 - **Sound Design:** Layering ambient sounds and SFX to make the environment feel immersive.
- **Music Supervision:**
 - Selecting tracks that match the emotional beat of the video and cutting to the beat where appropriate.
- **Color Correction:**

- Matching different cameras so the look is consistent across the entire edit.

3. Motion Graphics Designer

This role adds the professional polish and helps communicate information that isn't captured on camera.

- **Visual Development:**
 - If needed, creating "Style Frames" (static versions of what the graphics will look like) to get approval before animating.
 - Working with provided brand assets (artwork, logos, fonts, color palettes) to ensure brand consistency.
- **Titling & Lower Thirds:**
 - Designing and animating names and titles for subjects appearing on screen.
- **Graphic Animation:**
 - Building call-outs, infographics, or other animations to explain complex concepts.
 - Applying "easing" to animations to ensure movement feels natural and fluid rather than robotic.
- **Compositing:**
 - Keying green screen footage and layering with backgrounds.
 - Assisting with background cleanup (removing unwanted objects in the background of a shot using tracking).
- **Final Production:**
 - Adding SFX for motion graphics.
 - Exporting final versions of videos for review by Video Director and Design Director.

Video Director

The Director bridges the gap between the initial "why" of the project and the final "how." They are the primary stakeholder who ensures the project meets its goals.

Phase 1: Project Initiation & Pre-Production

- **Creative Briefing:** Defining the "Big Idea," target audience, and the desired goal/vision.
- **Script & Storyboard Approval:** Reviewing the script or visual plan to ensure it aligns with the project's objectives.
- **Talent & Location Scouting:** Making the final call on who will be on camera and where the shoot will take place to ensure the visual "vibe" is correct.

Phase 2: Production Support (as needed)

- **On-Set Direction:** While the Production Lead handles the lights and cameras, the Director focuses on the *performance*—ensuring the subjects are comfortable and delivering the message effectively.
- **Creative Problem Solving:** Acting as the "tie-breaker" if technical challenges arise.
- **Accessibility:** Remaining available for the Editor or Motion Designer to clarify the intent of a specific scene or graphic style.

Phase 3: Post-Production Review & Delivery

- **The "Director's Cut" Review:** Watching the rough cut to provide feedback on pacing, tone, and whether the story is clear.
- **Quality Control (QC):** Checking for small errors (typos in graphics, audio glitches) that the team might have missed.
- **Final Sign-off:** Giving the green light for the final render and ensuring the video is delivered in the correct formats for its intended platforms.
